Buyer's Quick Guide

PROMISE Rich Media Solutions

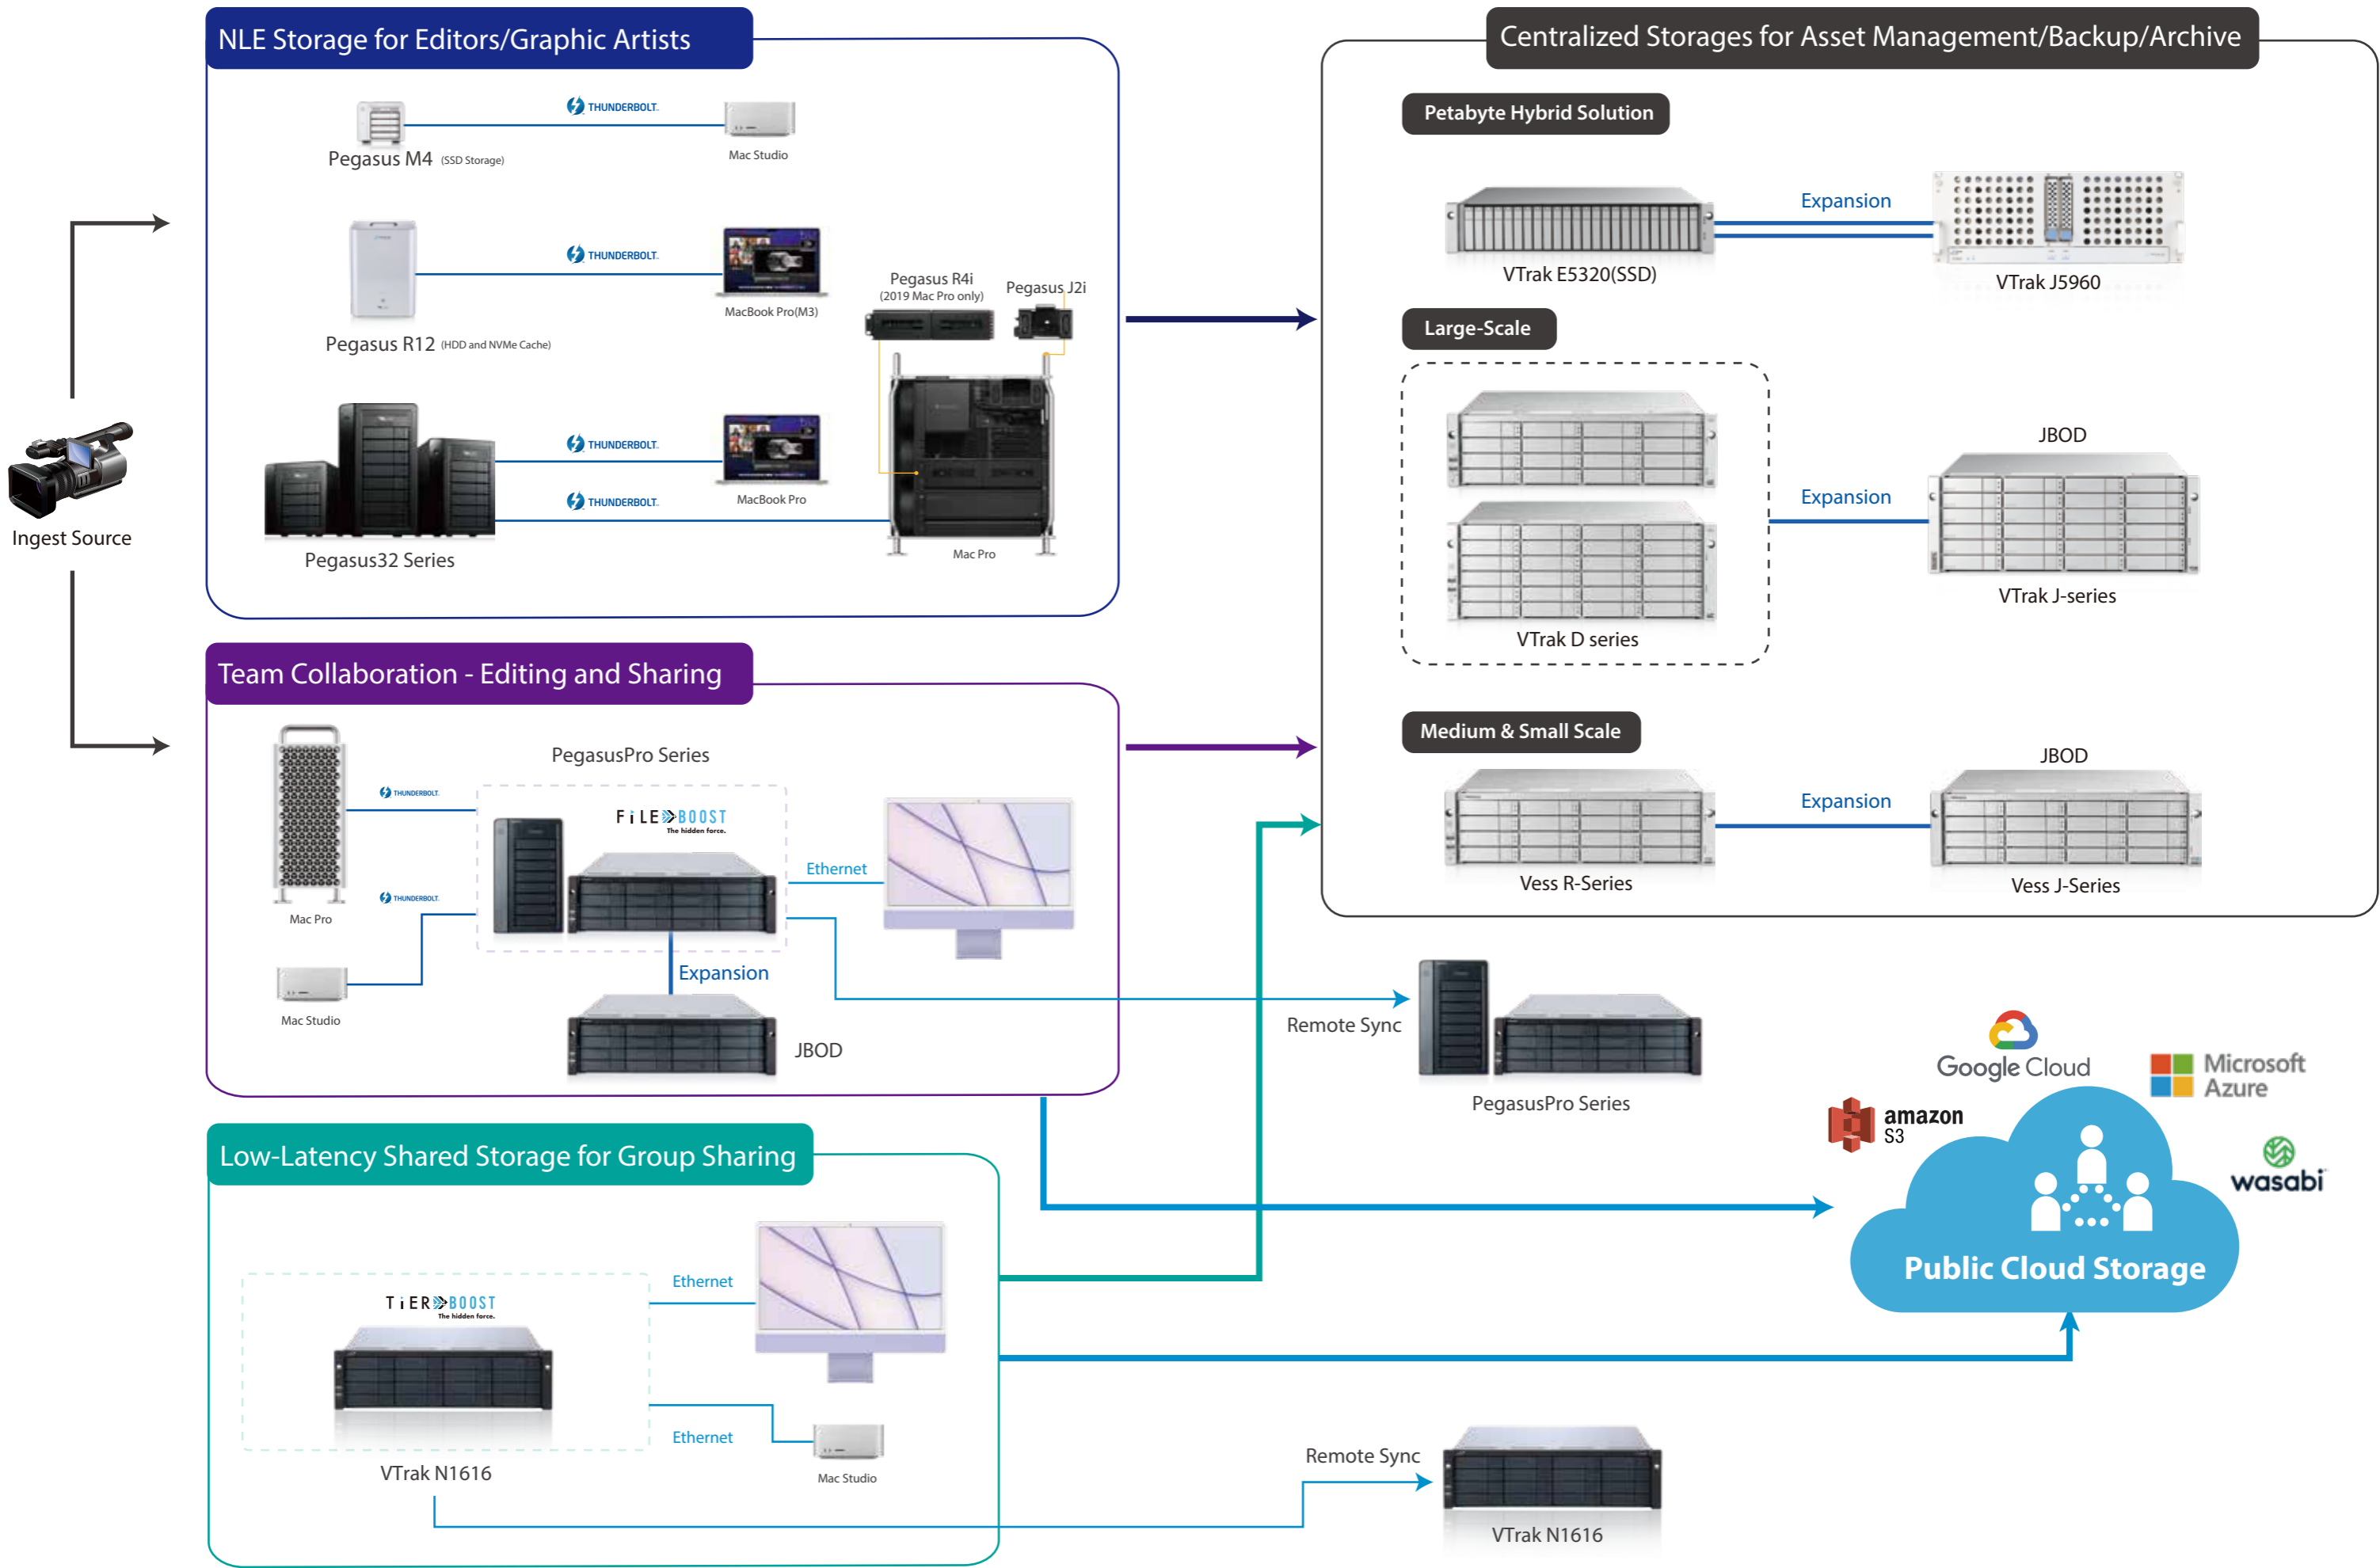

Optimized for Rich Media Workflow

PROMISE varied Rich Media product line ranges from portable Pegasus Thunderbolt™ RAID devices suitable for on-site usage, to efficient PegasusPro Thunderbolt™ and NAS shared storage systems designed for team collaboration, and finally, large-scale VTrak unified storage systems purpose-built for collaborative post-production and digital asset archiving.

PROMISE's rich media solutions boast robust high-speed performance, facilitating large volumes of footage from multiple cameras to be offloaded to a Pegasus device on-site. Subsequently, the raw footage can be seamlessly transferred to a RAID-protected storage network system for post-production.

This guide features specifications and product descriptions for the entire current line of Rich Media post production subsystems including the latest additions, PegasusPro and VTrak N-Series high performance NAS systems engineered specifically for post production workflow efficiency.

Solution for Post-Production Workflow

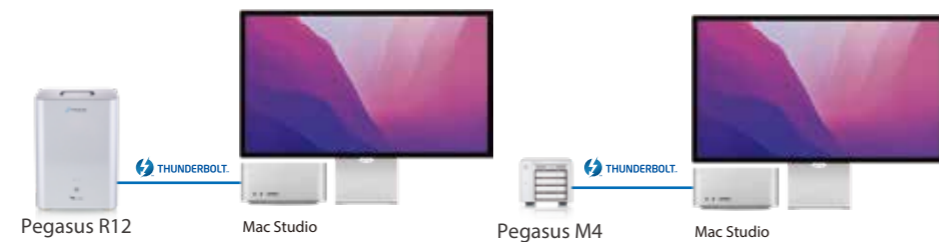

Post Production Edit

Editorial development is the crucial phase where your project takes shape. During this stage, the raw media you've ingested is transformed into a polished program. Some projects are entirely crafted within editing applications, allowing you to create titles, apply effects, and handle sound design directly in your editing sequence.

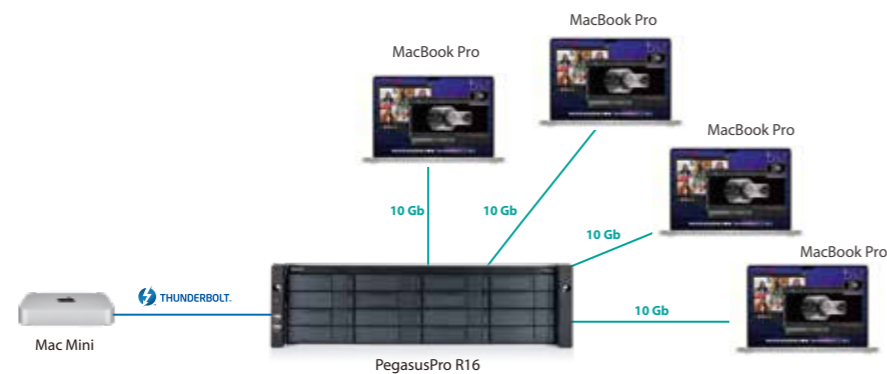

As you progress, you have the flexibility to send specific audio clips from the Timeline directly to Soundtrack. This enables tasks such as noise elimination, creating ambient noise to fill gaps, and applying equalization adjustments on a clip-by-clip basis. Whether you opt for a single application or multiple ones, all elements of the program converge in your edited sequence, serving as a guide for your editorial decisions as you strive to finalize the content.

A post-production team can greatly benefit from utilizing editing applications to efficiently manage project and media files. This can be achieved through thunderbolt storage, storage area network (SAN) storage, or Network Attached Storage (NAS). Promise Technology offers a comprehensive product portfolio designed to facilitate easy-to-use Thunderbolt storage, high-performance shared SAN storage, and collaborative shared storage solutions for group editing.

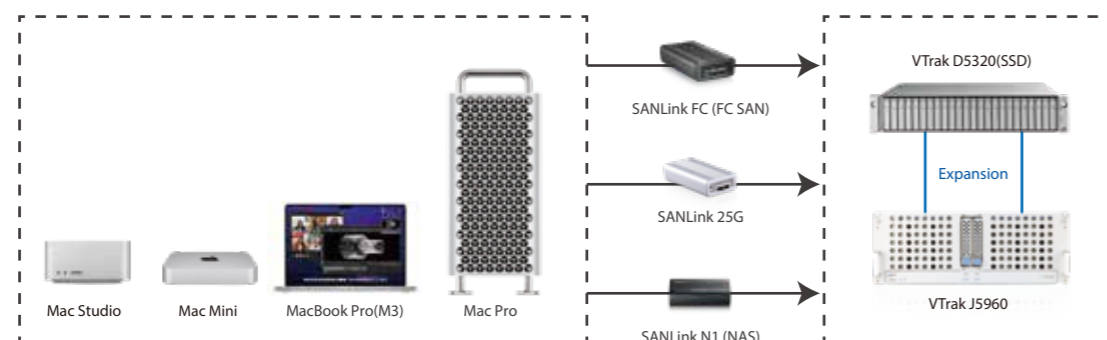

Thunderbolt™ Storage

Thunderbolt™ / NAS Shared Storage

SAN/NAS Hybrid Storage

Content Review, Finishing and Mastering

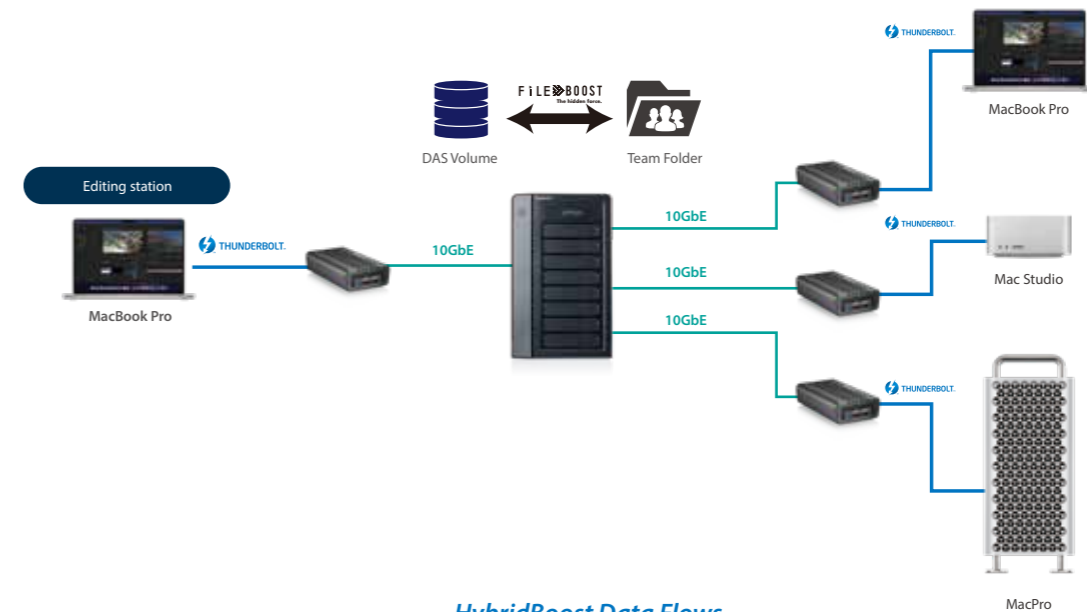

If you're working on a project for a client, receiving frequent and specific feedback is crucial. During supervised sessions, you can easily showcase your project directly from the Timeline. However, there are instances when you may find yourself working independently, collaborating with clients who are geographically distant, or aiming to share a version of the program for screening at another location.

Promise storage solutions offer various methods for delivering individual clips or entire sequences to clients for remote viewing. This can be accomplished through fileboost technology, facilitating the transfer of files from Thunderbolt Direct Attached Storage (DAS) volumes to shared Network Attached Storage (NAS) volumes. Alternatively, Hybridboost technology provides options for syncing, backing up, and archiving content to public cloud services or other storage devices located remotely.

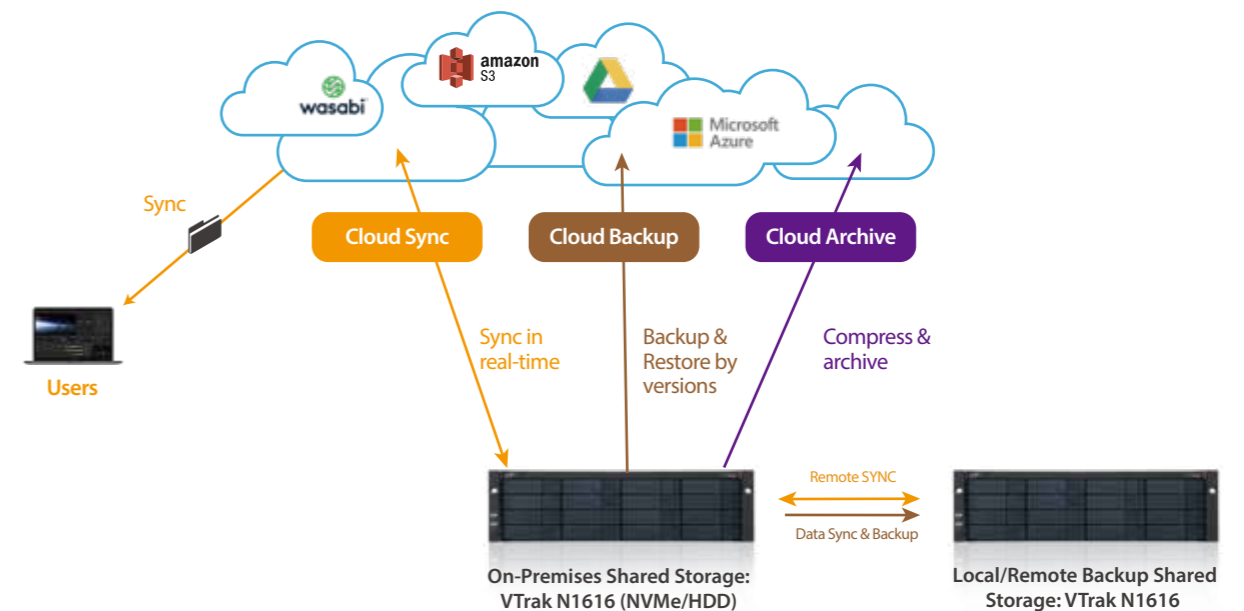

After a program's story has been edited and reviewed, it's time to give the program its final polish and tweak it to conform to the highest-quality version of the original source media available. The mastering process may involve assembling a much longer list of deliverable media files. Promise storage solutions have optimized firmware, allowing access to media in different formats to ensure reliability, while the compressor facilitates the format-conversion process.
